

Examples: Presenting findings on health expenditure

In countries where national health accounts (NHAs) have been conducted, SHOPS typically analyzes the data prior to conducting an assessment, with a particular focus on examining the flow of funding through the private health sector.

In this example, NHA analysis was used as one indicator of the size of the private health market in Kenya. It was concluded that the estimate was conservative because it excluded expenses for health policy and health education, a booming industry in 2009.

Team members conducted secondary analysis of DHS and NHA data in advance of the Tanzania assessment, so time in country was dedicated to confirming existing data and filling information gaps. Outputs of NHA data analysis conducted during the Learn phase are presented below.

Table 4.2: Provider Distribution as a % of Total Health Expenditures

Facilities	% of THE	% of THE _{HIV}	% of THE _{MALARIA}	% of THE _{RCH}
Public Facilities	46.6	35.9	52.5	67.9
PFP Facilities	7.6	2.7	5.9	6.9
PNFP Facilities	13.5	14.6	13.4	18.0
All Health Facilities	67.7	53.2	71.8	92.8
